

C1
cont. a therapeutic bioabsorbable element in a pre-delivery state prior to its delivery to a soft tissue site of a patient;

said bioabsorbable element being of a material which is in a post-delivery state at the target tissue site, the bioabsorbable element being remotely visualizable within the surrounding soft tissue when in the post-delivery state; and
the therapeutic agent comprising a radiation agent.

In The Specification

Page 4, cancel the paragraph at lines 7-21 and substitute the following paragraph. The addition of this sentence involves no new matter because it is taken from originally filed claims 10 and 11.

C2
In addition to permitting the biopsy site to be located by subsequent palpation or other means, the invention also can provide hemostasis and therapeutic benefits. The bioabsorbable element may comprise a therapeutic agent; the therapeutic agent may comprise at least a chosen one of a chemotherapeutic agent, a radiation agent and a gene therapy agent. Since the bioabsorbability can be varied from a day or two to a year or more, the material may be used to treat the diseased tissue and not just locate it. Some current therapies include radiation, chemotherapy, gene therapy as well as other technologies and therapies. Because the bioabsorbability can be easily varied, a medium can be placed into the bioabsorbable element and be externally excited or triggered in those cases where the biopsy results are malignant. Further, the bioabsorbability concept can be used for future implantation of a therapeutic agent. For example, if the bioabsorbable element is a dehydrated collagen, this material could be used as a reservoir for, for example, delivery of materials that effect chemotherapy, brachytherapy, etc. Once the laboratory results are received and show the biopsy is malignant and therapy is required, by surgical excision or otherwise, the physician may inject, for example, a radiation pellet, a chemotherapeutic agent or a gene therapeutic agent into or adjacent to the bioabsorbable element for direct treatment of the diseased tissue.
